	3.6	Counters	7	

1 Motivation

So I wanted a package that allowed me to mix-and-match exercises. I couldn't find it, so I made it.

2 Flow/Moderate start

I suspect that working with this package will break you current flow. So let's go throught it.

This package assumes you put all of your exercises within the folder named exercises

Let's build all of them first. In the main file, (the one where you include this package):

```
main.tex

\documentclass{article}
\usepackage{exbank}
\makeset{myExerciseSet}{myexercise}
\begin{document}
\buildset{myExerciseSet}
\end{document}
```

This builds the entire set, and adds Problem header and part problem counters ((1a) and (1b)) by default.

2.1 Select

Now, let's build only the second problem.

```
main.tex

\documentclass{article}
\usepackage{exbank}
\makeset{myExerciseSet}{\select{myexercise}{2}}
\begin{document}
\buildset{myExerciseSet}
\end{document}
```

This should only build the intro and the one exercise you \selected! Now, say you want to hide the intro. Well all you have to do in this case is make the package treat the intro as a problem in regards to what is \selected. Just add the optional argument $[\langle intro \rangle]$ to \make. That is switch

```
\makeset{myExerciseSet}{\select{myexercise}{2}}
```

with

```
\makeset[intro]{myExerciseSet}{\select{myexercise}{3}}
```

Notice that there are 3 'partproblems' now since we have to count the intro!

2.2 Exclude

But what if you have an exercise with 12 partproblems, and you only want to exclude the 7th partproblem? Well, then **\Exclude** is here to rescue the day for you.

```
\makeset{myExerciseSet}{\exclude{soManyExercises}{7}}
```

Here it's important to note that the [intro] argument would not make the intros disappear. If we wanted to only exclude the intro from our previous example file exercises/myexercise.tex we would do

```
\makeset[intro]{myExerciseSet}{\exclude{myexercise}{1}}
```

So we're excluding the partproblem 1. But that's the intro when we send the [intro] optional argument

2.3 Multiple

In \makeset you can just separate exercises with commas! Here is an example: Let's say you have two files with exercises. One located in exercises/circuits/RLC.tex and one in exercises/ohm/ohmsGeneralLaw.tex, and you want to include part-problem 1 through 5 from RLC.tex and all of the exercises from ohmsGeneralLaw.tex.

```
\makeset{\select{circuits/RLC}{1,...,5}, ohmsGeneralLaw}
```

This will divide it up with problem headers. So that what is in the RLC.tex-file will be Problem 1, and ohmsGeneralLaw.tex Problem 2.

2.4 Mixnmatch

What if you want to make both of them the same exercise? Well, then you pass the [nohead] argument to \makeset:

```
\makeset[nohead]{\phead, \select{circuits/RLC}{1,...,5}, ohmsGeneralLaw}
```

The \phead command makes a problem header. You can pass them as much as you want:

2.5 Solutions

The last thing to cover then is solutions. In your exercise files you just use the solution environment

```
\begin{solution}
Solution goes here
\end{solution}
```

They are hidden by default, so you would have to use **\DisplaySolutions** in your main file to display them.

That covers the basics. Enjoy

```
\begin{problem},\end{problem},
\begin{solution},\end{solution},
\begin{intro} and \end{intro} has to be on their own line without any spaces!
```

3 Reference

3.1 Making sets

```
\mbox{\mbox{$\mbox{makeset}$} [\langle intro, nohead \rangle] {\langle filable \rangle}}
```

This command is the one you use to make a set! Later you use **\buildset** to build the sets you make. The $\langle filable \rangle$ argument is either the name of the file relative to the **\exerciseDir**-path (default its in the root called exercises), or you could use the **\select** or **\exerciseDir**-path (default its in the root called

pick or exclude exercises. (See their docs).

[\(\int intro\)] this counts the intro environment as a part problem, so that you can \select or \exclude the intro

 $\lceil \langle nohead \rangle \rceil$ prevents the builder from adding a problem header. This is handy if you want to create an exercise that is composed of multiple parts. You can use the **\phead** to insert the problem header where you want it

 $\ensuremath{\comma}$ $\ensuremath{\comma}$

As you can see in the intro section of the documentation, this is for excluding partproblems To be used in $\mbox{\tt makeset}^{\to P.4}$

As you can see in the intro section of the documentation, this is for cherry picking partproblems To be used in $\mbox{\tt makeset}^{\to P.4}$

```
\mathbf{pplabel}\{\langle label \rangle\}
```

Labels a partproblem. You can reference to it later using $\pref{\langle label \rangle}$

 $\pref{\langle label \rangle}$

Reference a partproblem created by $\place{bel}{\langle label}$. This prints e.g. 1c)

 $\pref{\langle label \rangle}$

Reference a partproblem created by $\protect\operatorname{pplabel}{\langle label \rangle}$. This prints e.g. 1

3.2 Environments

```
\begin{problem}
  ⟨environment content⟩
  \end{problem}
```

Inside the exercises folder, you keep your exercises. Inside there you'd use a problem environment to write your partproblems. It might be a little confusing that you're using \begin{problem} instead of \begin{partproblem} when you're writing a partproblem, but it's less typing.

\end{problem} has to be on it's own line without any leading spaces!

\begin{solution}
⟨environment content⟩
\end{solution}

Things inside here is only visible if $\DisplaySolutions^{\rightarrow P.6}$ are given before $\begin{document}$

\end{solution} has to be on it's own line without any leading spaces!

\DisplaySolutions

Turns on the solutions, so they are shown.

```
\begin{intro}
  \langle environment content \rangle
\end{intro}
```

Sometimes you'd want to introcude your exercises and tell a little bit about it. Maybe have a figure there also. Those things should go inside this environment. This can be treated as a problem in terms of counting. See \makeset^{P.4} for more info.

\end{intro} has to be on it's own line without any leading spaces!

3.3 Internationalization

 $\translateExBank{\langle Translation key/vals \rangle}$

This is to translate the text inside the package. As of now the available key/values are

- Problem
- Solution

The Norwegian translation would then be done with

\translateExBank{Problem=Oppgave, Solution=Løsning}

3.4 Triggers

```
\Trigger{\langle Any\ Macro \rangle}
See \At^{\rightarrow P.7}
Triggers available:
```

3.5 General reference

\ownLineNoSpacesGotIt

This is to annoy the user enough to get his attention about the requirements of the problem P.5, solution P.5 and intro environments. Compilation wont work unless \end{problem}, \end{solution} and \end{intro} are on their own lines and without any spaces. This warning can be removed by doing \def\ownLineNoSpacesGotIt before \usepackage{exbank}.

$\st Exercises Dir{\langle directory \rangle}$

This is the directory, relative to the file you included the package, where the package should be looking for exercises. Default is exercises This package also includes some extra stuff. For example the **\At** and **\Trigger**

$\At{\langle AnyMacro \rangle}$

Here you can send any macro because it isn't evaluated! For example \At\BeginSomething is fine and even if \BeginSomething is not defined. Also and when using \Trigger it just ignores it if it didn't exist. It's pretty similar in function as to \AtBeginDocument.

```
\At\BeginSomething{DoSomething}
Which is triggered with
\Trigger\BeginSomething, this evaluates to DoSomething
```

3.6 Counters

problem counter-counter holds the current problem number and partproblem counter-counter holds the current partproblem number.
